

for women of all ages

## Early detection of breast changes can save not only your breasts, but your life.

Exciting new technology brought to you by BreastLogic can help you find these early changes. Developed in the USA over the past 8 years, Computerised Breast Imaging is now gaining momentum worldwide.

BreastLogic offers all women (including under 40 years) the option of regular breast examinations without discomfort, exposure to radiation or compression of the breast. Another great benefit is that the sensors are not confused by dense breast tissue, scars or implants. Small breasts are also easily scanned.

Self examinations can now be less confusing and more reliable.

With sensors up to 4 times more sensitive than the human touch, BreastLogic's scanning procedure reliably finds hard masses and can scan areas not covered by mammograms.

Any masses found are recorded as a digital image and permanently stored for future comparison, including size, shape, volume and relative hardness. Examinations are non-invasive, quick and comfortable. A printed breast map is provided immediately for your personal records.

No test can find all breast changes. Any abnormal changes should be reported to your Doctor.

BreastLogic is committed to improving women's health by encouraging breast awareness.
